

Postojna, Slovenia

Population

agglomeration: 16,207
city: 9,482

Land area

33 km²

Population density

285 inhabitants/km²

Postojna has intensive daily migration activity, where cars are still the most common means of transportation for commuter travelling to work to other municipalities. Public transportation is not frequent enough and accessible enough to be used daily. Walking and cycling are not recognised as an attractive modes of mobility because the pedestrian and cycling infrastructure are not developed and safe enough to be used daily.

The population growth in the municipality increases the need to improve public transportation and other means of sustainable mobility.
